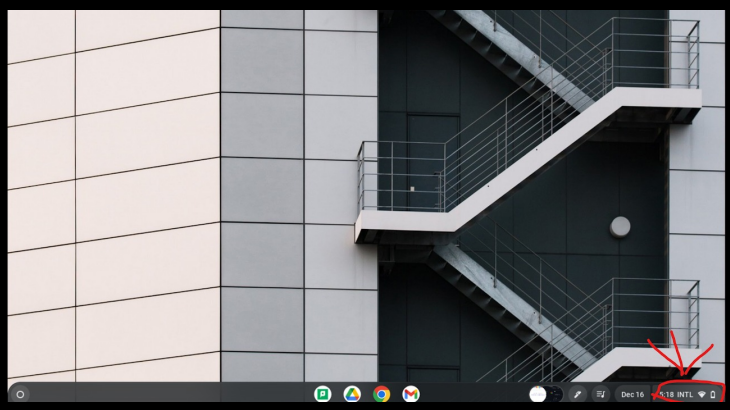
[Swamp] for Chrome OS

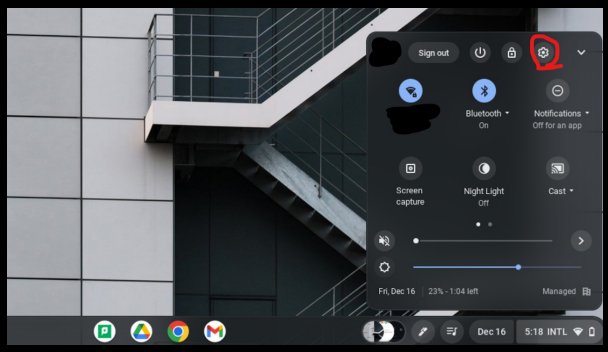
Swamp launcher can:

- Disable force-installed extensions like #!tbeef even on Chrome 106 when it's patched
- Run bookmarklets on any page even when they are blocked
- **Break GoGuardian until powerwash (or until you turn GoGuardian back on)**
- Run a custom filter to block network requests (such as to goguardian.com) without actually being on a DNS
- Run your own custom code with access to most of the chrome API

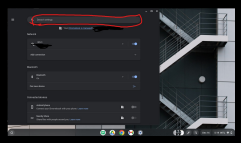
1. Click in the far bottom right when on any page

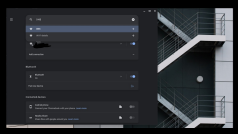


2. Click on the gear icon



3. Search "DNS" in settings

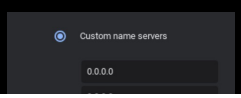


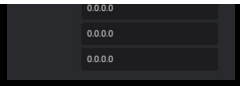


4. Click on the first result

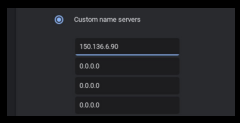
5. Select Custom name seervers

6. Change all of the boxes to 0.0.0.0





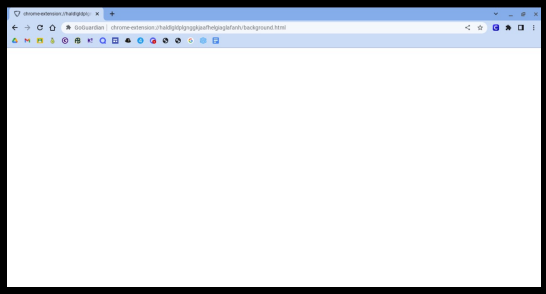
7. Wait 5 seconds then change the first one to 150.136.6.90



Important note:
while your connection is on Custom name servers you will not be able to access some sites, there is a step at the end to swap this back.

8. Open up Google and go to a new tab
in that new tab put the link: http://tinyurl.com/s-w-a-m-p

Your page should like this



9. Do the keybind CTRL+SHIFT+R to reload the page

10. your page should still be white(just like before step 9), now IN THE SAME TAB put

https://ssl.google-analytics.com/swamp

in the search bar

11. click on the big red triangle in the middle of the page(nothing will happen)

12. type "thisisunsafe" on your keyboard, there is not a textbox.

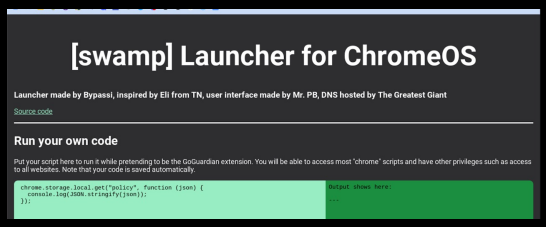
make sure you type it with

No spaces

No capital letters

13. if you type it wrong, do CTRL+SHIFT+R and then repeat steps 11&12 untill it works

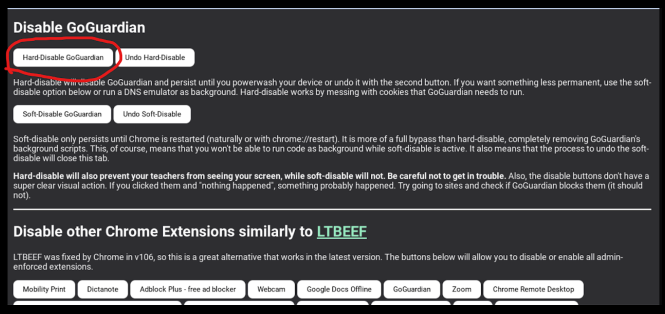
14. if you type it correctly you should be directed to swamp launcher



How to enable recommended options:

15. Scroll down a bit until you see a "hard disable" button and click it, there is nothing that will pop up on your screen and the gogaurdian icon will still be there, however you can go to a blocked site(like Discord or TikTok, keep in mind your browsing history is still visible to the Admins) and it should work.

this bypass will work until the Chromebook is power washed or downgraded to a lower version



16. Scroll down even more to the very bottom of the page and press the "disable all admin forced exept gogaurdian" button
This bypass will reset when the chomebook is turned off and back on again, unlike the hard-disable GoGaurdian one

17. repeat steps 1-4

Select "automatic name servers" to get some sites working again.

Now you can access websites recommended websites are at: Recommended websites
